
Supplementary Figure 1. Evaluation of the clinical significance of the prognostic model in the testing cohort. (A) Visualization of high- and low-risk groups based on risk scores of HCC patients in the testing cohort. (B) Expression profiles of 4 ubiquitin-related genes in high- and low-risk groups in the testing cohort. (C) Visualization of survival status and risk score in patients with HCC in the testing cohort. (D, E) Kaplan–Meier (D) and ROC (E) analyses of risk score and overall survival of HCC patients in the testing cohort. HCC, hepatocellular carcinoma; ROC, receiver operating characteristic.
