

Supplementary Figure 9. The inhibitory effect of cephalomannine and PX-478 on the viability of HCC cells *in vitro*. (A, B) The inhibitory effect of cephalomannine (A) or PX-478 (B) on the viability of HCCLM3 cells was detected by cytotoxicity assays. (C) The inhibitory effect of combined treatment of cephalomannine and PX-478 on the viability of HCCLM3 cells detected by cytotoxicity assays. The concentration of cephalomannine and PX-478 is 0.04 and 10 μM, respectively. Data were analyzed by one-way ANOVA. ***P<0.001. HCC, hepatocellular carcinoma.
